

WHITE PAPER - PUSHUPTOKEN

Introduction

PushUpToken is an innovative cryptocurrency designed to ensure a constant increase in value through a transparent, participatory, and automated mathematical system. The goal is to create a continuous growth mechanism that allows all users to benefit from incoming liquidity.

Mechanism of operation

- The purchase price of the token increases linearly (e.g., 0.0001 BNB per transaction).
- Users can buy variable amounts, including fractions.
- Redemption is calculated with a distribution function that returns a proportional share of the investment plus a gain depending on entry timing.
- A 2% penalty is applied to redemptions.
- The contract creator receives 0.25% of each transaction.
- The contract assigns the creator 1,000,000 tokens freely redeemable at market value.

Economic guarantees

- The system is inspired by fiat money emission, but democratizes the gain.
- Liquidity is not tied to the number of tokens but to new transactions.
- A function is available to check the contract's balance at any time.

Global perspective

PushUpToken can become a global standard for those seeking a safe haven, offering mathematically sustainable and constant gains.

Shortened roadmap

- Phase 1: Deploy on testnet (completed)
- Phase 2: Manual validation with 3 accounts (completed)
- Phase 3: Deploy on BSC Mainnet
- Phase 4: Viral promotion and outreach
- Phase 5: Data analysis and advanced interface development
